

4.1 Continued ECOSYSTEMS

Quadrat Sampling of Communities

Quadrats

- is a 'square' sample area used in research
- an area is measured and gridded.
- random numbers are used to choose sample areas
- multiple (many) quadrats are taken to get an accurate prediction

Quadrat /Association between Species using a Chi -square test

The presence of two species is recorded using quadrat samples

A contingency table is created to show # of quadrats with one or both species

		Species A	
		Present	Absent
Species B	Present		
	Absent		

Expected results assuming no association are calculated using

$$\text{Expected frequency} = \frac{\text{row total} \times \text{column total}}{\text{grand total}}$$

Quadrat / Association between Species using a Chi -square test

Example sample results...

		Species A	
		Present	Absent
Species B	Present	24 25.2	12 10.8
	Absent	11 9.8	3 4.2

$$\text{Expected frequency} = \frac{\text{row total} \times \text{column total}}{\text{grand total}}$$

Quadrat /Association between Species using a Chi -square test

Calculate χ^2

		Species A	
		Present	Absent
Species B	Present	24 25.2	12 10.8
	Absent	11 9.8	3 4.2

$$\chi^2 = \sum \frac{(f_o - f_e)^2}{f_e}$$

$$\chi^2 = \frac{(24 - 25.2)^2}{25.2} + \frac{(12 - 10.8)^2}{10.8} + \frac{(11 - 9.8)^2}{9.8} + \frac{(3 - 4.2)^2}{4.2}$$

$$\chi^2 = 0.06 + 0.13 + 0.15 + 0.34$$

$$\chi^2 = 0.683 \quad \text{Significant } \chi^2 = 3.84 \quad \text{not significant at 5\% therefore no association}$$

Ecosystems

Communities interacting with the abiotic factors of the environment

These include

- air
- water
- soil/rocks
- geographical formations

Both abiotic factors and organisms can influence each other.—> a highly interactive systems (ECOSYSTEM)

Ecosystems

Cycling of Nutrients is required for proper ecosystems

- inorganic nutrient are required by all organisms (eg. carbon, O₂, calcium.. etc (Required elements)
 - cycling maintains a constant supply
 - rarely simple —> many withdraws and returns with cycles
- eg consumption vs excretion

Mesocosms

Ecosystems are sustainable over time if...

- proper nutrient cycling (availability)
- detoxification (waste removal)
- supply of energy (light)

To test scientist use mesocosms

- sealed environmental set up to study ecological research
 - needs autotrophs
 - consumers (saprophytes/decomposers/herbivores/carnivores)
 - consumers should be small in size and numbers (proportional to systems size)
